Tarea 1: Crear y popular la DB

1. Cree un nuevo schema llamado `lyfter_car_rental`. Sobre este schema serán trabajados todos los siguientes ejercicios, incluyendo los de Python.
2. Cree un script donde se cree una tabla de usuarios.
    1. Una de las columnas debe ser un ID único **autoincremental**.
    2. Esta tabla necesita ser capaz de almacenar el nombre del usuario, su correo, su username y password, así como su fecha de nacimiento y el estado de su cuenta.
    3. Adicionalmente, el script debe popular la tabla con al menos 50 usuarios nuevos. **El script debe funcionar con una única ejecución, o sea que la tabla debe crearse y seguidamente debe popularse.**

    > 💡 En muchos casos vamos a tener que generar datos falsos para hacer pruebas. Acá algunas páginas que te pueden ayudar:
    >
    > - Mockaroo - Random Data Gen...
    > - generatedata.com
    > - RNDGen Random Generator

3. Cree un script igual al anterior, pero para una tabla de automóviles.
    1. Esta tabla requiere además del ID, columnas para marca, modelo, año de fabricación y estado del automóvil.

4. Finalmente, cree una tabla cruz para relacionar los alquileres de los carros con los usuarios.
    1. Esta tabla requiere además de la relación, datos adicionales como fecha de alquiler y estado del alquiler. La fecha debe ser autogenerada al ingresar la nueva fila.

Total rows: 52 Query complete 00:00:00.184 CRLF Ln 1

3. Listado

    1. Listar todos los usuarios

2. Listar todos los automóviles

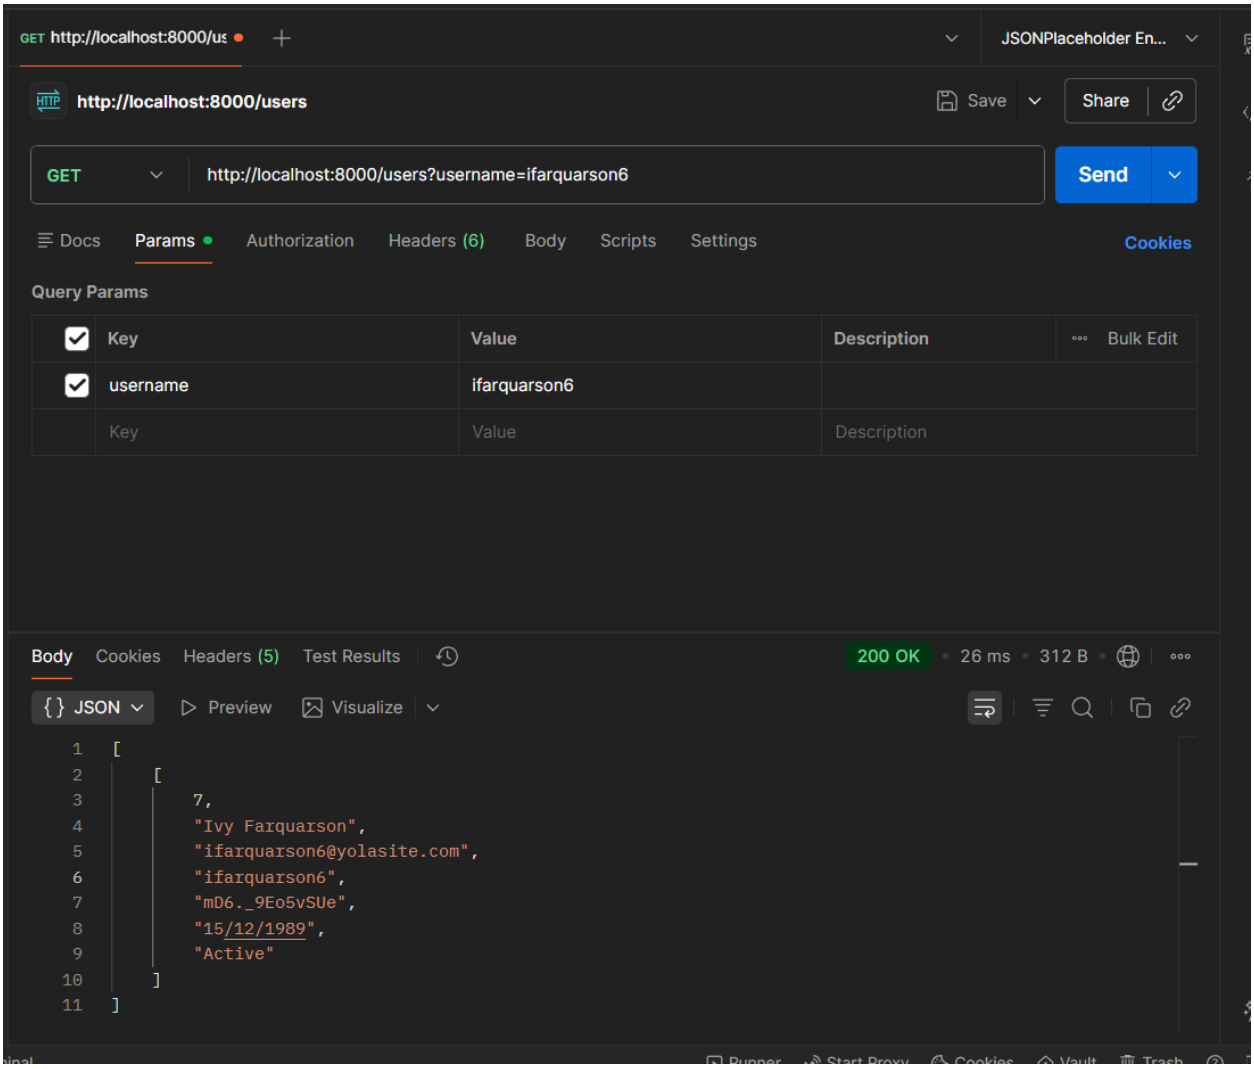

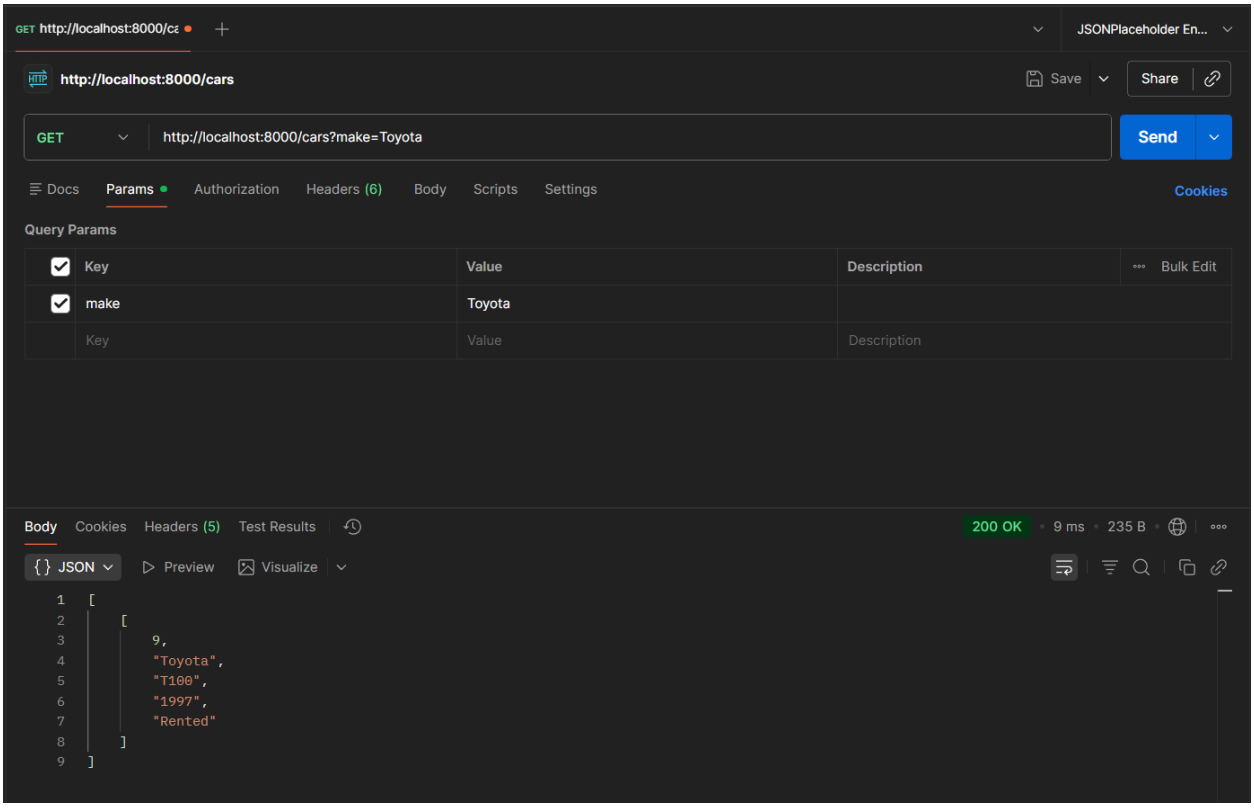

3. Listar todos los alquileres

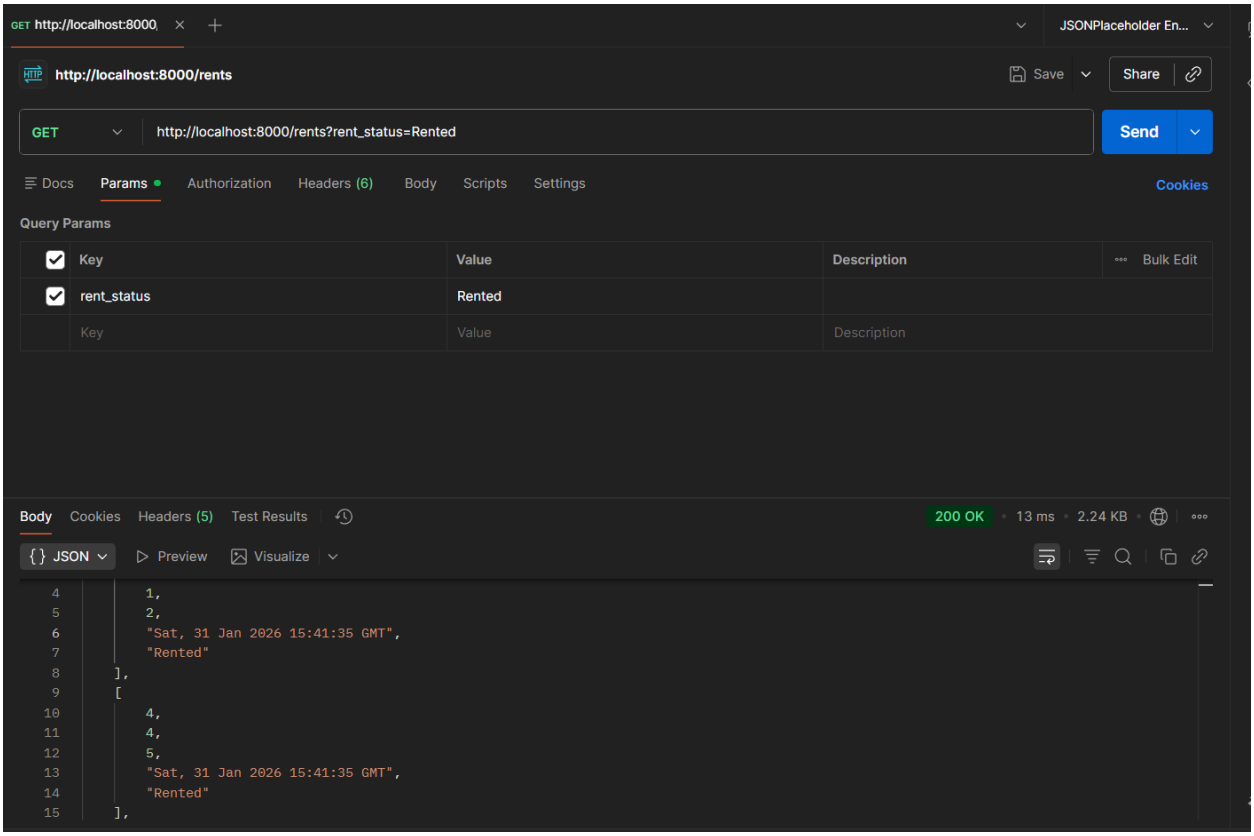

4. Nota: Todos los endpoints de listado deben ser capaces de aceptar filtros. Por ejemplo:
    1. El listado de usuarios debe ser capaz de filtrar por username
    2. El listado de autos debe ser capaz de filtrar por modelo
    3. El listado de alquileres debe ser capaz de filtrar por estado

Estos son solo ejemplos, y los endpoints deben soportar filtros por cualquier columna de la tabla que consulten.
